Stripe Dashboard vs Stripe CLI

Neither is "better" overall because they serve two completely different purposes; **the Dashboard is best for configuration, viewing data, and production**, while **the Stripe CLI is best for local coding, testing, and debugging.**

Feature	Stripe Dashboard	Stripe CLI
Best For	Business management, analytics, monitoring production webhooks, manual refunds, and creating products.	Writing code, testing localhost webhooks, triggering mock events, and automating developer workflows.
Interface	Web UI (visual, click-based).	Command Line / Terminal.
Localhost Webhooks	Cannot reach localhost directly (requires a public tunnel like ngrok).	Routes directly to localhost automatically (stripe listen).
Testing Events	Requires manual checkout UI actions or re-sendi ng past events.	Instant mock events with one command (e.g., stripe trigger payment_intent.succeeded).
Production Setup	Required. This is where you configure your live se rver's webhook URL.	Not used in production.

Stripe used

At-a-glance

Stripe is a payment processing platform that helps businesses accept payments from customers online or in person.

ACCEPT PAYMENTS

Customers can pay using Visa, Mastercard, and other payment methods.

20XX

Jan

How Stripe earns money

Stripe mainly earns money by charging **businesses/merchants fees for processing payments**.

The **actual Stripe fee depends on the country, payment method, and Stripe pricing**, so $1.75 is only an example.

Customer pays	$50.00	
Stripe fee	-1.75	2.9%

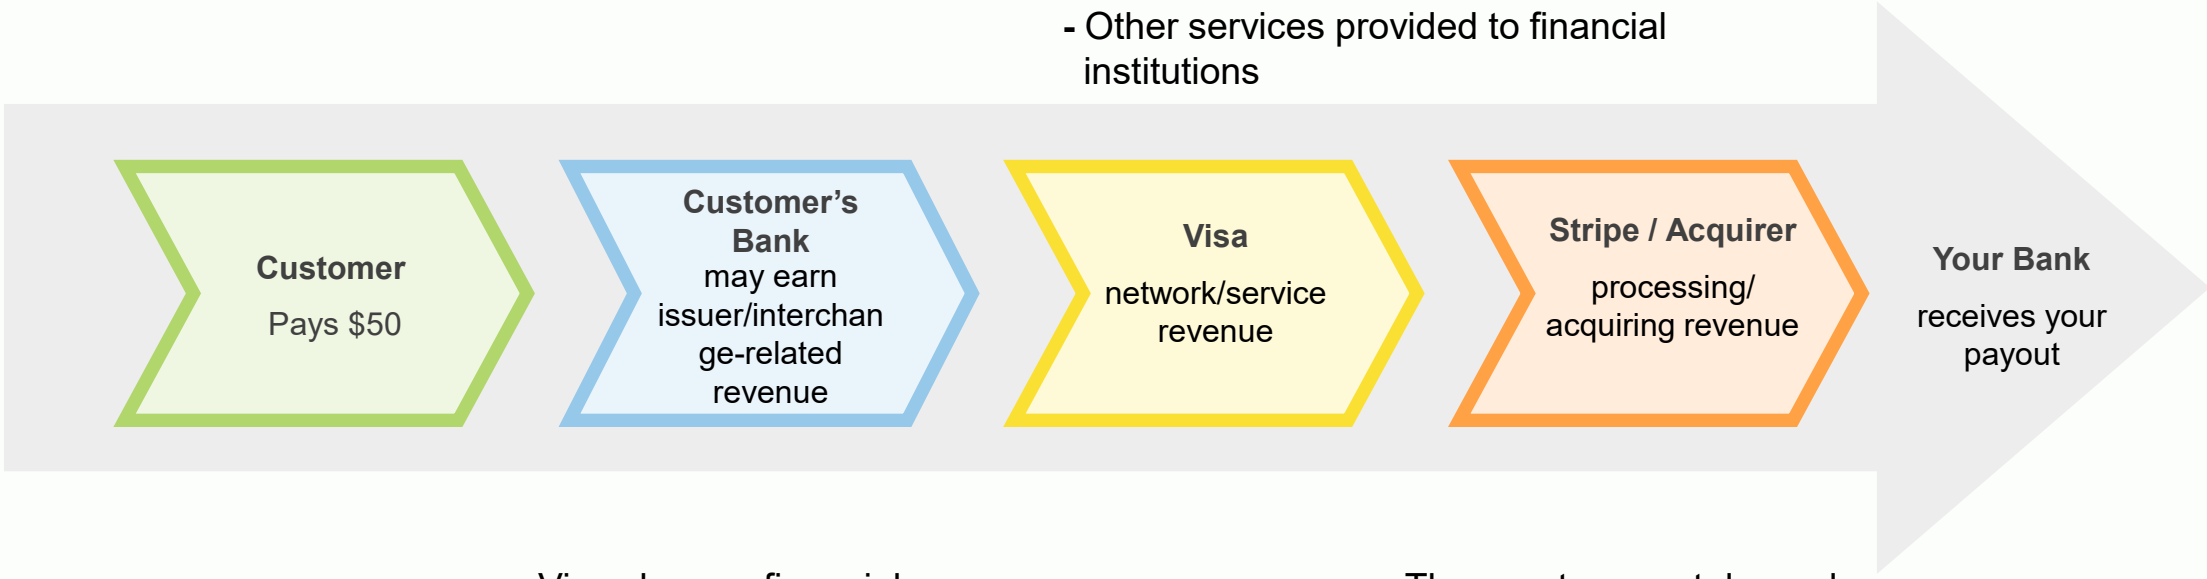

You receive	$48.25	

Stripe also makes money from other business services, such as billing, subscriptions, fraud tools, issuing, and other financial infrastructure.

How VISA earns money

Visa generally **doesn't make money by taking your customer's $50 and keeping part of it**.

Visa can earn fees from things such as:
- **Network/service fees**
- **Data processing fees**
- **International transaction-related fees**
- Other services provided to financial institutions

Visa charges financial institutions for using its payment network and related services.

The exact amount depends on the transaction and agreements between the parties.

Summary

VISA vs. Stripe

Visa: A payment network that connects the customer's bank and the merchant's bank. It helps process card transactions and earns network fees.

Stripe: A payment processing platform that helps your website accept payments. It charges processing fees and sends your money to your bank.

$50 Payment Flow

Stripe

Customer > Customer's Bank > Visa Network > Stripe > Your Stripe Balance > Your Bank Account

VISA

Customer > Customer's Bank > Visa Network > Your Bank Account

Simple summary: Visa connects the banks; Stripe processes your website payments and pays you.
