# Dynamic Systems Development Method

## Business Focus

01

Deliver most important business value early

## Timeboxing

02

Always complete projects on time within schedule

## MoSCoW Prioritization

03

Maintain clear and consistent business priorities

## User involvement

04

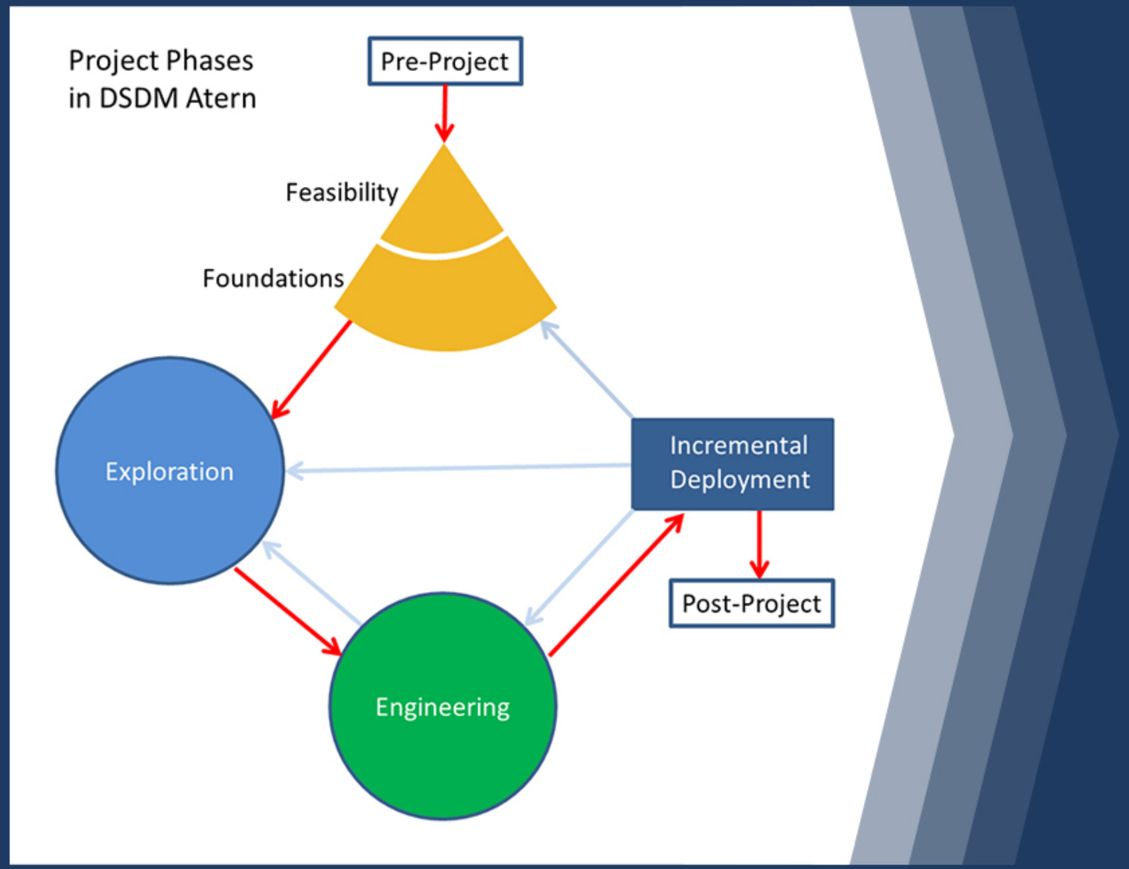

Promote strong communication and collaboration

## Iterative & Incremental Development

05

Always continuously improve quality and processes

# ABOUT

## 📜 History of DSDM

The Dynamic Systems Development Method (DSDM) was created in 1994 in the United Kingdom as a response to problems with traditional software development methods that were often slow, expensive, and inflexible.

## ⭐ It is used to

For manage the process of developing a system for a business.

**What DSDM is used for**

- DSDM is used to manage and organize software development projects, for example:
  - ✅ Develop business software systems
  - ✅ Manage project teams and tasks
  - ✅ Plan, build, test, and deliver software

**What DSDM is used for**

- ❌ It does not create a business
- ❌ It does not write code itself
- ❌ It does not manage employees in a company

📌 **Node: DSDM is an Agile project management method used to plan, develop, test, and improve software systems based on business requirements.**

# What is DSDM

DSDM was developed in 1994 by the DSDM Consortium in the United Kingdom.

01

## What is

Dynamic Systems Development Method (DSDM) is an Agile project management and software development framework that focuses on delivering business value quickly and efficiently

02

## Simple Definition

DSDM is an Agile method that delivers working solutions in small stages while keeping strong focus on business needs and deadlines

03

## Main Purpose

+ Deliver the most important features first
+ Keep projects on schedule
+ Involve users continuously
+ Maintain high quality

04

## Key Characteristics

+ Iterative & incremental development
+ Timeboxing (fixed time periods)
+ MoSCoW prioritization (Must, Should, Could, Won't)
+ Strong collaboration between team and users

# Core Philosophy

Build the right system at the right time.

1 **Focus on Business Need**

Always build what gives real business value

2 **Deliver on Time**

Finishing projects on schedule is very important

3 **Collaborate**

Teamwork between developers and users

4 **Never Compromise Quality**

Quality must not be sacrificed

5 **Build Incrementally**

Develop step-by-step, not all at once

6 **Develop Iteratively**

Improve through repeated cycles

7 **Communicate Continuously**

Keep everyone updated

8 **Demonstrate Control**

Have strong project management and monitoring

# Core Philosophy

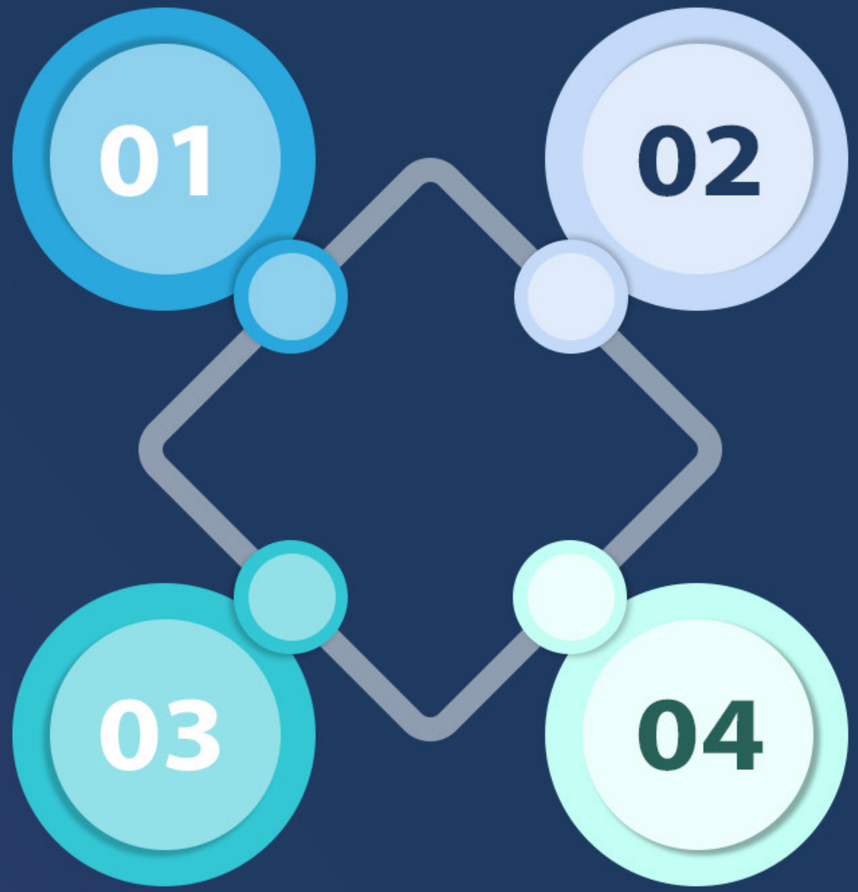

DSDM has 8 core principles

## Focus on Business Need

Always align decisions with project goals; use Timeboxing and MoSCoW prioritization to deliver the right business needs at the right time.

## Deliver on Time

Delivering products on time is essential for projects; plan timeboxes in advance and set fixed delivery dates while adjusting features based on business priorities.

## Cooperate

Teams should work collaboratively, involve subject matter experts, and use facilitated workshops to share knowledge with stakeholders & support better decision -making.

## Never Compromise Quality

In DSDM, quality standards are agreed at the start, and work should be “good enough” by building quality through early, continuous testing and regular reviews.

# Core Philosophy

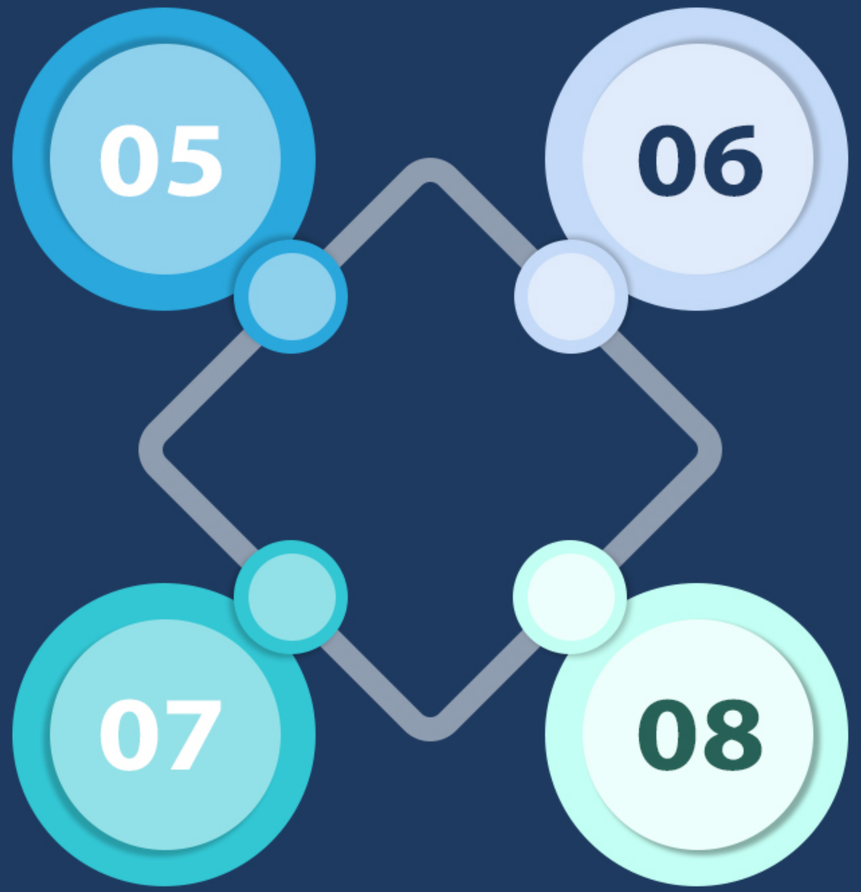

DSDM has 8 core principles

## Build Incrementally

Before major development, teams should understand the business problem and proposed solution clearly, but avoid excessive detail that delays progress.

## Develop Iteratively

Iterative delivery is central to DSDM, recognizing that solutions improve over time, so embracing change helps teams refine and deliver more accurate results.

## Communicate Continuously

Strong communication drives project success—use daily stand-ups, workshops, and early models or prototypes to share progress, and encourage regular face-to-face interaction to avoid misunderstandings.

## Demonstrate Control

Show control of the project by making plans and progress visible, using formal tracking and reporting, and measuring success by delivered products rather than completed tasks.

# DSDM Lifecycle

6 Phases

## 01 Pre-Project

- Identify a business opportunity.
- Recognize a problem or new idea.
- Decide whether the project is worth considering.

## 02 Feasibility

- Check if project is technically and financially possible.
- Analyze technical feasibility.
- Estimate cost and time.

## 03 Foundations

Define:
- Build strong project foundation.
- Requirements
- Architecture
- High-level project plan

## 04 Evolutionary Development

- Develop + test features iteratively Build small parts (increments).
- Get user feedback.
- Improve continuously.

## 05 Deployment

- Release system to users.
- Deliver product.
- User training.
- Go live.

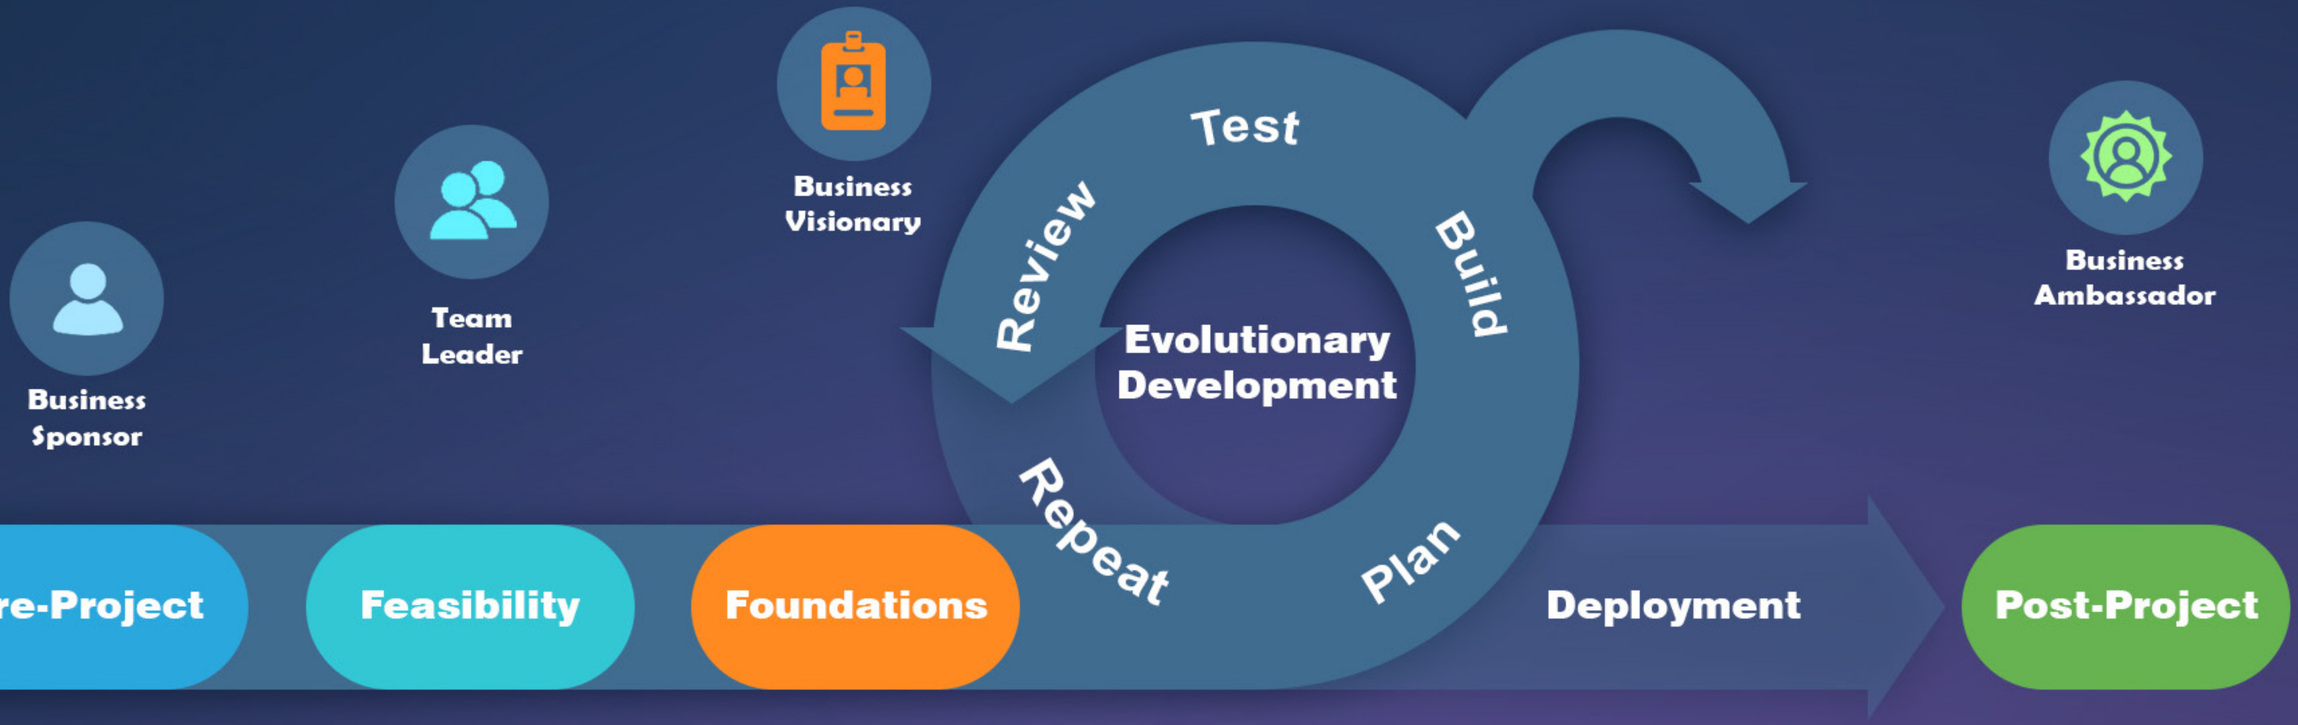

## 06 Post-Project

- Maintenance and benefit review Fix bugs.
- System updates.
- Continuous improvement.

# How Do It Work

DSDM flow with iteration

In DSDM, Post-Project ends the lifecycle. Any further development is treated as a new project starting again from Pre-Project.

So:

- Same project → ❌ cannot go back
- New project → ✅ a new lifecycle starts

# DSDM Lifecycle

# MoSCoW

DSDM uses MoSCoW method to prioritize requirements

## M 01

### Must Have

Must Have requirements are critical and essential for the system to work.

**Characteristics**

- Absolutely necessary
- System cannot run without it
- Required for legal, safety, core
- Highest priority

## S 02

### Should Have

Should Have requirements are important but not critical. The system can still work without them

**Characteristics**

- High priority but not essential
- Can be delayed temporarily
- System still works without them

## C 03

### Could Have

Could Have requirements are desirable but optional. They are usually added if there is extra time or resources.

**Characteristics**

- Nice to have
- Low priority
- Easy to remove if needed

## W 04

### Won't Have

Won't Have requirements are features that will not be implemented in the current release.

**Characteristics**

- Not included in this version
- May be implemented later
- Helps prevent scope creep

## Business Roles

These roles represent the business side (users and stakeholders). They ensure the system delivers real business value.

# Roles

roles are clearly defined so everyone in the project knows who is responsible for what.

01

### Business Sponsor

- The most senior person responsible for the project.
- Provides funding and resources.
- Makes final business decisions.
- Ensures the project supports business goals.

02

### Business Visionary

- Defines the overall vision of the system.
- Ensures the project solves the real business problem.
- Guides the team about what the system should achieve.

03

### Business Ambassador

- Represents the daily needs of users.
- Works closely with the development team.

Think of this role like a bridge between users and developers.

04

### Business Advisor

- Provides specialized knowledge.
- Helps the team understand specific business processes.

Example:

- Accountant
- Sales expert

# Roles

These roles represent the business side (users and stakeholders). They ensure the system delivers real business value.

## Solution Development Team Roles

These roles are the technical team that builds the system.

05

### Technical Coordinator

- Responsible for technical architecture.
- Ensures the system is make technically correct.

**Main responsibilities**

- Define system architecture

06

### Team Leader

- Leads the development team.
- Manages daily technical work.

**Main responsibilities**

- Coordinate developers
- Ensure tasks are completed

07

### Solution Developer

- The programmers or engineers.
- They design, code, and build the system.

Examples:

- Software developers
- Database developers

08

### Solution Tester

- Responsible for testing the system.

**Main responsibilities**

- Check for bugs
- Validate requirements
- Ensure quality

# Roles

## Management Roles

These roles ensure the project is well organized and controlled.

09

### Project Manager

- Manages the whole project.
- Responsible for time, budget, and resources.

**Main responsibilities**

- Plan the project
- Track progress

10

### Workshop Facilitator

- Runs workshops and meetings.
- Ensures discussions are productive and efficient.

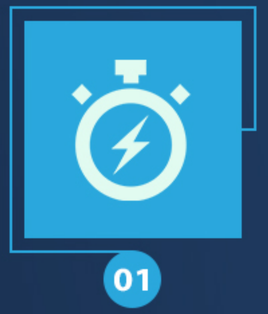

**Main responsibilities**

- Guide workshops
- Resolve communication issues

# Advantage

DSDM (Dynamic Systems Development Method) is an Agile project management and software development framework that focuses on fast delivery, user involvement, and iterative development.

01

## Fast Delivery

- DSDM uses timeboxing, meaning work must be completed within a fixed time period.
- This helps deliver software quickly and on schedule.

02

## Strong User Involve

- Users are involved throughout the project.
- Their feedback helps ensure the system meets real business needs.

03

## Improved Quality

- Continuous testing and reviews are done during development.
- Problems can be detected and fixed early.

04

## Flexible to Changes

- Requirements can change during development.
- DSDM handles changes using the MoSCoW prioritization technique (Must have, Should have, Could have, Won't have).

05

## Clear Project Control

- The method defines roles and responsibilities clearly (Project Manager, Developer, Tester, Business User, etc.).
- This helps manage the project effectively.

06

## Reduced Risk

- Frequent deliveries and reviews help identify risks early.
- Issues can be solved before they become big problems.

07

## Better Communication

- Team members, stakeholders, and users communicate regularly.
- This improves understanding and collaboration.

# Disadvantage

DSDM (Dynamic Systems Development Method) is an Agile project management and software development framework that focuses on fast delivery, user involvement, and iterative development.

01

## Requires Active User

- Users must be available frequently.
- If users are not involved, the project may fail.

02

## Not Suitable Small

- DSDM has many roles and processes.
- It may be too complex for small or simple projects.

03

## Requires Experience

- Continuous testing and reviews are done during development.
- Problems can be detected and fixed early.

04

## Higher Cost

- Continuous meetings, testing, and user involvement can increase project cost.

05

## Difficult for Fixed Budget Projects

- Because requirements can change, it may be hard to maintain strict cost control.

06

## Documentation May Be Limited

- Agile focus on working software may reduce detailed documentation.

07

## Not Ideal for Large Distributed Teams

- DSDM requires frequent communication and collaboration.
- This can be difficult when teams are in different locations.

# DSDM & Waterfall

Important differences between them

## Iterative Development

01

Development is done in repeated cycles and improvements.

## Flexible Requirements

02

Changes can be made during development.

## High User Involvement

03

Users participate and give feedback regularly.

## Early Delivery

04

Working software is delivered in small parts quickly.

## Sequential Development

01

Each phase is completed step by step.

## Fixed Requirements

02

Changes are difficult after the project begins.

## Low User Involvement

03

Users are mostly involved at the beginning.

## Late Delivery

04

The full system is delivered at the end of the project.

# When to Use DSDM?

DSDM is an Agile project management and software development method.

01

## When Requirements May Change

Use DSDM when project requirements are not fully clear at the beginning or may change during development.

02

## When Fast Delivery is Needed

DSDM is suitable when the project must be delivered quickly.

- Work is divided into short development cycles (iterations).
- Important features are delivered first.

03

## When Users Can Participate Actively

Use DSDM when users or clients can be involved in the project.

- Users give continuous feedback.
- Developers improve the system based on feedback.

04

## When the Project Needs Clear Priorities

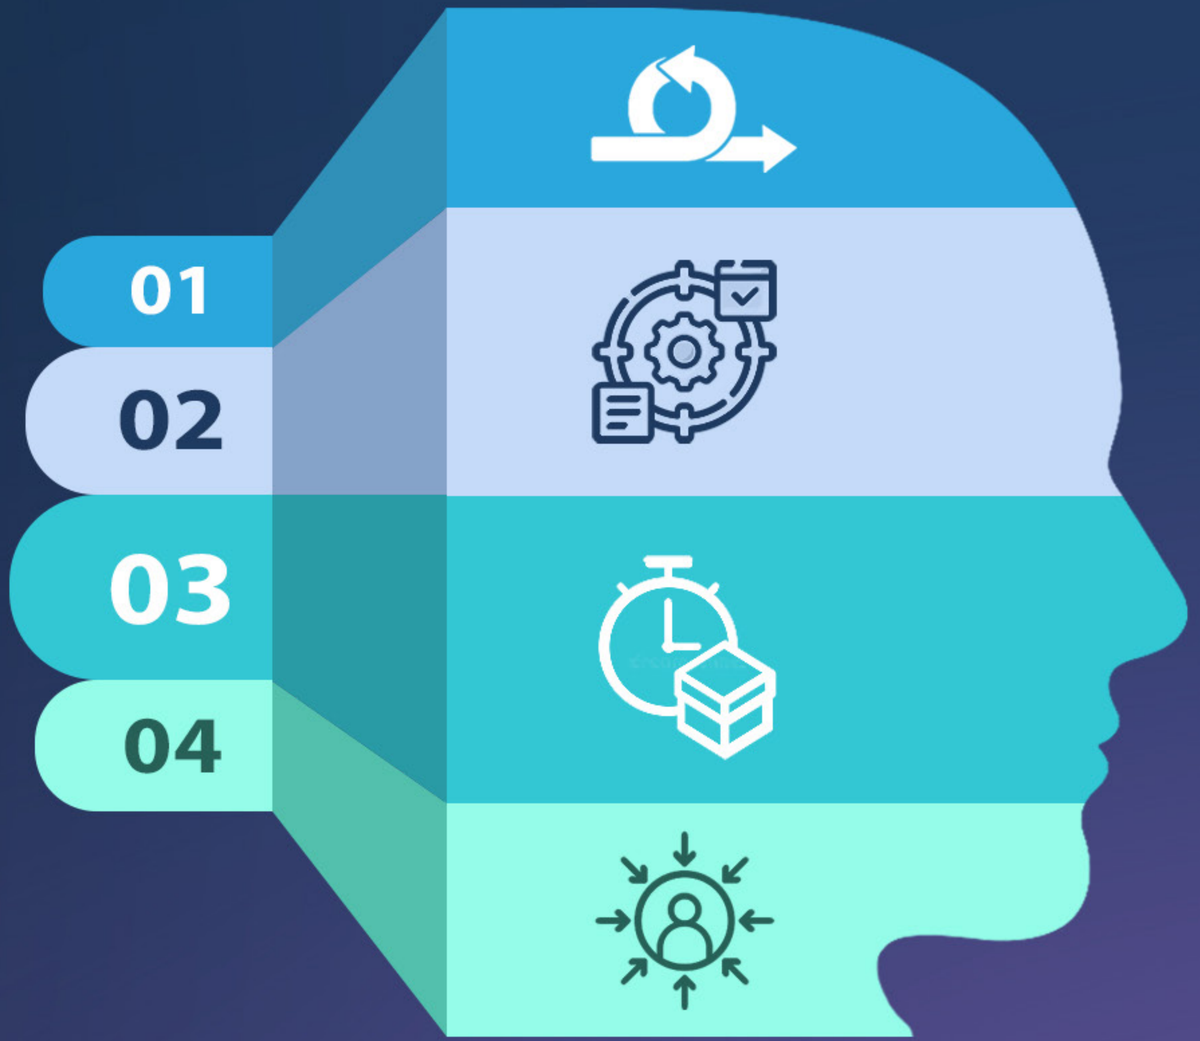

DSDM uses MoSCoW prioritization:

- Must Have
- Should Have
- Could Have
- Won't Have (for now)

Ex: This helps teams focus on important features first.

# Summary

## Agile

Flexible approach that adapts to changing requirements.

## Business-focused

Ensures the system delivers real value to the business.

## Time-boxed

Work is completed within fixed time periods to ensure fast delivery.

## User-centered

Active user involvement ensures the product meets user needs.
